PROFILE

I build e-commerce interfaces. At Zent I built the merchant dashboard alone, from an empty repo to more than 18 production pages, and I work on the multi-tenant storefront engine that serves every merchant's store from a single Next.js codebase. Merchants run their businesses on these pages every day. Speed matters to me in a practical way: pages load in about a second, with skeleton states instead of blank screens, because a slow store loses sales.

EXPERIENCE

Software Engineer (Frontend), Zent Technologies • Lagos

January 2024 – Present

E-commerce platform where African businesses launch online stores, take multi-currency payments, and manage inventory and deliveries.

- Built the merchant vendor dashboard from an empty repo to more than 18 production pages as the only frontend engineer: orders, products, inventory, analytics, and payouts. 1,000+ onboarded merchants use it daily.
- Built the multi-tenant storefront layer powering 500+ live stores. The server resolves which merchant owns each request from the hostname (subdomains and custom domains), fetches store data in parallel, and pre-seeds the client cache before first paint, so shoppers never see a logo flash or a client-side fetch waterfall.
- Integrated Paystack, Stripe, Flutterwave, and Nomba across checkout and payout flows.
- Wrote a tiered wholesale pricing engine where quantities pool across product variants to unlock bulk prices, with multi-currency support and money math that avoids floating-point errors.
- Everything ships fully responsive and typed end to end with TypeScript, deployed through Vercel with CI on GitHub Actions.

Independent & Team Projects

2024 – Present

LockedIn — accountability app where focus partners co-work in timed sessions. Started at a hackathon; now a five-person team with the app live on [Google Play](#) (1K+ installs).

- Own the web side: the Next.js web app (accounts, instant sessions — 36 production deployments), a React video call room with session timers and join tokens, and the [public landing pages](#) ([source](#)).

Wanderr — travel platform built with a three-person team (frontend, backend, marketing). I built the whole frontend: trips, interactive maps, and an AI-assisted planning feature in Next.js and TypeScript. Live at [gowanderr.com](#).

SELECTED PROJECTS

Transaction Monitoring Dashboard (open source • [live demo](#) • [source](#))

- A monitoring interface of the kind a fintech compliance team would use all day: KPI dashboard, filterable transactions table, and a detail drawer with risk indicators. Feature-driven architecture, with server state (TanStack Query) and UI state (Zustand) kept separate. Tested with Vitest and React Testing Library.

Another 20+ shipped projects (storefronts, dashboards, mobile apps) are on the [portfolio](#).

SKILLS

Expert: React, Next.js (App Router), TypeScript, Redux/RTK Query, React Query, Zustand, Tailwind CSS, SSR & web performance, payment integrations (Stripe, Paystack, Flutterwave, Nomba)

Testing: Vitest (Jest-compatible) and React Testing Library, with a public test suite on the open-source dashboard. Currently adding Cypress e2e coverage.

Working: CI/CD (Vercel, Netlify, GitHub Actions), analytics & event tracking (Meta Pixel), React Native, Node.js tooling, SEO fundamentals, Figma-to-code

Learning: Shopify Liquid and Hydrogen (building a demo theme on a Shopify dev store), and AWS fundamentals.

EDUCATION

B.Tech, Computer Science, Federal University of Technology, Akure

2019 – 2024

LANGUAGES & BEYOND CODE

English (native) • Yoruba (native) • French (basic) • Calisthenics (first set: 15 strict pull-ups) and team sports: football, volleyball, basketball. I play acoustic and lead guitar, and keyboard. Currently learning to swim.
